

toot.ai Vision Pitch

Hi, I am Otto. Together with Jim, Daniele and Filippo we are developing knowledge as a platform that would help you toot your problems away.

For a long time, I have been an engineer and a developer. I am constantly piled under endless pages of documentation. Most of the time, those pages are not structured at all, let alone in a nicely findable way. I know the solution to my small technical question is out there but **where exactly???**

That's why we have decided to flip the switch. We are developing a smart knowledge platform to help us find the solution fast.

But that's not all...

We are building an explainable AI assistant to help engineers and developers find the solution for them and carry it out.

While your assistant manages all those tasks, you are able to focus your expertise on the more important. What can be better than this, right?

Instead of fixing bugs, you can develop awesome assistants, for example.

To build such a cool platform, we have gathered all the necessary skills to our team.

We use machine learning to create a solution to the technical problem.
We use human focused assistant to make our platform easily usable.
We use understandable reasoning on an open knowledge platform.
And we use data mining to find what pains the engineers the most.

The first problem we are tackling is solving the disk space issue.

We already have an international customer to help us along with this. And the problem for them is HUUUGE.

-

They have 15000 servers with a lot of disks.

-

There is an error event every 10 minutes on average.

-

A proper resolution costs them 1 man hour

-

which translates roughly into 50 € per issue.

-

With our solution, we cut the cost to 1 €.

We are reducing their cost 50 times and this gives a full hour back to the engineer... maybe to spend around the coffee machine or the water cooler. Wink - wink.

As the problem is HUUUGE for the company, the market reflects that as well.

Companies in the sector of Managed Service Providers are currently spending roughly 20bn € on these issues. That is per year. In Western Europe alone.

That has created the opportunity of 400m € for us. That is per year. In Western Europe alone.

Today, I am sharing only the starting point in how to make world better through technology. We are tooting at tedious manual tasks which no engineer ever wants to do.

We give humanity back its freedom, creativity and drive to innovate. First through engineers, later through all people who have ever hated doing a manual task.

Now, what do **you** want to do next?
